-!- FUNCTION: THIS PROTEIN IS ONE OF THE NUCLEAR-CODED POLYPEPTIDE CHAINS OF CYTOCHROME C OXIDASE, THE TERMINAL OXIDASE IN MITOCHONEIAL ELECTRON TRANSPORT.

-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)O.
                                                                                                                                                                                                                                                                         STRAIN=Wistar; TISSUE=Liver, and Heart;

SUBUNIT.
-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + H(+)(Out).
-!- SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE SUBUNITS: F-TYPE MAIN SUBUNITS: A, B AND C.
-!- SUBUNITS: A, B AND C.
-!- SUBCELLULAR LOCATION: Mitochondrial.
-!- SUBCELLULAR LOCATION: Mitochondrial.
-!- SIMILARITY: BELONGS TO THE ATPASE ALPHA/BETA CHAINS FAMILY.
-!- SIMILARITY: DOCG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Periplaneta americana (American cockroach).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(CDR H2) of the heavy chain of murine anti-CD23 (FCERII) monoclonal
antibody C11 (see also AAX32263). The invention provides altered
antibodies, such as chimeric or humanised antibodies, which comprise
cutficient of the amino acid sequences of C11 light and heavy chain
CDRs (see AAX3224-59) to render them capable of binding to the CD23
cype II molecule expressed on haemacopoietic cells. The antibodies
are used to block soluble CD23 formation for treatment of arthritis,
type II molecule expressed on haemacopoietic cells. The antibodies
c are used to block soluble CD23 formation for treatment of arthritis,

                                                                          with prostate stem cell antigen (PSCA) by administering an antibody which selectively binds to PSCA and inhibits the growth of the cancer cells. The PSCA gene is found on human chromosome 8Q24.2 The invention provides the human and murine PSCA protein and coding sequences, which can be used not only in the treatment of, but also in detection and prognosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention is concerned with producing scaffold proteins based upon the human CTLA-4 SCA domain. These scaffold proteins can be used as a scaffold to bind antigen- or receptor-binding fragments. These can be used in the treatment of diseases such as cancer, atherosclerosis, thrombosis, osteoporosis, rheumatoid arthritis and diabetic retinopathy. Sequences AAB22930-B2939 were used in the production of the proteins of the invention.
                                                              present invention describes a method of treating cancer associated

All peptides (AAAY6061) which forms part of a seaffold protein. As is a beta strand peptide which forms part of a beta sheet. Peptides (AAAY60605) which forms part of a beta sheet. Peptides (AAAY601-Y4609) which form a single-chain scaffold protein which contains at least 1 disulfide bond, contains less than 10% alpha helix and contains at least 6 beta-strands. The scaffold protein is constructed form the beta strands \$1.83, or any functionally equivalent derivative of these sequences. The beta strands form two beta sheets \$1/84/83 and \$6/85/82 with each strand connected to the next by hydrogen bonds, which generate a beta sandwich architecture. If the additional beta strands \$1.83 are included in the structure the scaffold is constructed of two beta sheets, with the structure the scaffold is constructed of two beta sheets, with the structure of the additional beta strands \$1.83 are included in the structure to caffold is constructed of two beta sheets, with the structure of the additional beta strands \$1.83 are included in the structure of the additional beta strands \$1.83 are included in the structure of the scaffold protein is used to stabilize antigens or whole proteins such as receptors, or their fragments. It may be used to target the complex to tumour cells. For example, one surface of the scaffold contains the scaffold protein may be used to target the complex to tumour cells. Another surface may be bound to a protein which binds to a tumour antigen. The scaffore the scaffold protein may be used to target chemotherapeutic agents to especific cells. It may also be used in charged the changues, and to stabilize antigens used as vaccines. Sequences AAY40680-Y40703 are functionally equivalent derivatives of the

This invention describes a novel method for the detection of a mammalian infection by an acid-resistant microorganism (A) by treating a faecal sample with at least two different monoclonal antibodies (MAD) (or their fragments or derivatives) or aptamers (collectively (I)) and detecting formation of a complex (C) between (I) and the corresponding antigen of (A). The first and second (I) bind to epitopes of different antigens (Ag). These epitopes are present, after passage through the intestines, in at least some mammals, and have either: (I) their native structure; or (II) a structure against which an antibody is produced by an animal infected or immunized with (A), or its extract, lysate, derived protein or fragment, or with a synthetic peptide. Practically all mammals display at least one of the specified epitopes. The method is used to detect infection by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and Campylobacter, specifically H. Pylori, H. hepaticus, the rapeutically. The method is direct and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible degradation of antigens during passage through the intestines. This sequed to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting infection by acid-fast microbes for diagnosis of Helicobacter pylori, comprises reacting a faecal sample with two binding reagents for antigens that survive intestinal passage

                                                                                                                                                                                                                                                                                                                                                               An antigen/antibody specificity exchanger comprises an antibody-derived amino acid sequence (A) which specifically binds to a particular antigen, linked to an amino acid sequence (C) to which example of a type (A) sequence; it is the CDR2 sequence of the heavy chain of monoclonal antibody C1.5. Preferred type (C) sequences are the antibody binding regions from viruses or other pathogens. The specificity exchanger can redirect antibodies already present in a patient and raised against a particular antigen, to fight a different antigen. For example, it was shown that anti-poliovirus antibodies could be redirected to fight HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention comprises a method of inhibiting graft rejection, graft versus host disease or chronic rejection of a transplanted graft. The method involves administering an antagonist of CC chemokine receptor 2 (CCR2) and optionally an immunosuppressive agent. The CCR2 antagonist may be an anti-CCR2 antibody (i.e. containing light and heavy chain complementarity determining regions from various non-human origins). CCR2 is known to be involved in the rejection of transplanted grafts. The method of the invention is useful for inhibiting graft rejection particularly allografts such as kidney, liver, lung, heart-lung, particularly allografts such as kidney, liver, lung, heart-lung, phancreas, bowel and heart. The method of the invention is also useful for inhibiting graft versus host disease and for inhibiting chronic rejection of a transplanted graft. The present amino acid sequence represents a mouse mAb 1D9 antibody heavy chain complementarity determining region 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Monoclonal antibody, MAb, lipoteichoic acid; gram positive, bacteria, immunoglobulin; phagocytosis; infection; epitope; peptide mimic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to a phage display library of variable heavy domain (VHH or VH) fragments (sdab fragments) derived from liama antibodies. The library is useful for in vitro selection against any antigen of interest as a target. Single domain anti-idiotypic antibody fragments are isolated from the library using phage display technology and an antibody serving as an antigen. Such anti-idiotypic antibody fragments have great potential in evoking the immune system response to pathological antigens and in vaccine development. The large size of the library considerably increases the probability of isolating from it antigen-binding fragments having high affinity to almost any predetermined target (antigen of interest). The library eliminates the development of anti-idiotypic antibodies by immunisation and allows isolation of anti-idiotypic antibodies by immunisation and allows the llama heavy chain domain fragments of the invention.
                                                                                                                                       New phage display library of variable heavy domain antigen-binding fragments derived from llama antibodies, useful for in vitro selection against any antigen of interest as a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                H-CDR-2 of anti-idiotype antibody against human anticancer antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel anti-idiotype antibody against an human anticancer monoclonal antibody - and DNA sequences encoding the antibody, useful in pharmacology, medicine and biochemical fields.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A new anti-idiotype antibody against a human anticancer monoconal antibody is claimed. This antibody contains in its heavy chain 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibody; cancer; CDR; heavy chain; light chain; immunoglobulin; complementarity determining region.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a monoclonal antibody (MAb) to lipoteichoic acid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin variable constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and killing of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacteria! They can also sequences AAW94735-39 represent heavy chain variable regions of the anti-lipoteichoic antibody 96-100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynuclectides cenceding different immunoglobulin binding protein (198P) polypeptides that specifically bind to a ligand or form one or more disulphide bonds with polypeptides in transfected cells, to generate an 198P that confines to a ligand, and transformed plant cells are selected, and preparing an 198P array in plant cells. At least one peptide sequence has confined and transformed plant cells. At least one peptide sequence at least 75* sequence identity to a framework region (FR) of a native confines, 196, 199, 199, 198, 197, kappa or lambda immunoglobulin molecule. The method is useful for preparing an immunoglobulin binding protein array, preferably heavy chain binding protein (GHBP) array in eukaryotic cells (e.g. Aprobacterium tumefaciens or maize) or other eukaryotic cells (e.g. Aprobacterium tumefaciens or maize) conther eukaryotic cells (e.g. insect cells or mammalian cells). The GHBP is useful for discovery of e.g. screening assays of 19BPs having confined characteristics. The present sequence is a mammalian cells. The invention.
                                                                                                                                                                                                                               ö
complemetarity determining regions CDR1 (AAR74929-R74931), CDR2 (AAR74932-R794931), this is also true of the light chain which has its own CDR1 (AAR74944-R74946 and AAR85774), CDR2 (AAR74947-R74949) and CDR3 (AAR74954). The antibody and DNA encoding it are useful in pharmacological, medical and blochemical fields.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preparing immunoglobulin binding protein array in plant cells by transforming the cells with different polynucleotides encoding binding protein polypeptides specific to ligand, selecting plant cells for preparing array

The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynucleotides cancing different immunoglobulin binding protein (198P) polypeptides that specifically bind to a ligand or form one or more disulphide bonds with polypeptides in transferded cells, to generate an 198P that binds to a ligand, and transformed plant cells are selected, and preparing an igpP array in plant cells. At least one peptide sequence identity to a framework region (FR) of a native 198, 196, 198, 190, 198, 197, kappa or lambda immunoglobulin molecule. The machod is useful for preparing an immunoglobulin binding protein carray, preferably plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic cells (e.g. insect cells or mammalian cells). The CHBP is useful for discovery of e.g. screening assays of 198Ps having desired characteristics. The present sequence is a mammalian cile or immunoglobulin derived peptide that may be incorporated into an 198P of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention is concerned with producing scaffold proteins based upon the human CTLA-4 SCA domain. These scaffold proteins can be used as a scaffold to bind antigen- or receptor-binding fragments. These can be used in the treatment of diseases such as cancer, atherosclerosis, thrombosis, osteoporosis, rheumatoid arthritis and diabetic retinopathy. Sequences AAB29930-B29939 were used in the production of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Complementarity determining region 2; Campath-1; Campath-1H; antibody; lymphoma; CD52 antigen; loop 2; immunological tolerance; minimal mutant; antibody therapy; antiglobulin response; heavy chain; CDR.
                                                                                                                                                                                                                                                                               Scaffold composed of single-chain polypeptide having beta sandwich architecture carrying new and randomized peptide sequences useful as supporting framework and carrying antigen- or receptor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /label= K7D

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A new anti-idiotype antibody against a human anticancer monoconal antibody is claimed. This antibody contains in its heavy chain 3 complemetarity determining regions CDR1 (ARR14929-R74911), CDR2 (AAR74932-R794935) and CDR3 (AAR74936-R74939), this is also true of the light chain which has its own CDR1 (AAR74944-R74946 and AAR8774), CDR2 (AAR74947-R74949) and CDR3 (AAR74956-R74954). The antibody and DNA encoding it are useful in pharmacological, medical and biochemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                               H-CDR-2 of anti-idiotype antibody against human anticancer antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, CTLA-4; scaffold protein; antigen-binding; receptor-binding;
SCA domain; cancer; thrombosis; osteoporosis, rheumatoid arthritis;
diabetic retinopathy; atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel anti-idiotype antibody against an human anticancer monoclonal antibody - and DNA sequences encoding the antibody, useful in pharmacology, medicine and biochemical fields.
                                                                                                                                                                                                                                                                                 Antibody; cancer; CDR; heavy chain; light chain; immunoglobulin; complementarity determining region.

Peptides AAW23390-95 represent "minimal" mutant sequences of the complementarity determining (CDR) region 2 of the humanised antibody Campath-11. Campath-111 heavy chain sequence encodes human protein at all positions, except the 3 CDR regions. Campath-1 antibodies have been used to induce remissions in lymphoma and leukemia patients and for the treatment of rheumatoid arthritis and vasculitis. The target and for the treatment of rheumatoid arthritis and vasculitis. The target and for DS2, which is a GDI-anchord cell-surface glycoprotein of lymphocytes and monocytes. Loop 2, represented by residues 4-9 of the present sequence, is important for binding to CD52. Mutations were made within this region so as to abolish binding of the antibody to CD52, which reduces affinity for the antigen, and induces immunological tolerance. The present mutant contains a single charge difference from Lys to Asp. The positive charge of Lys is thought to interact with the not this single mutation may destroy antigen binding. Antibody therapy is often limited by an anti-antibody (antiglobulin) response preventing retreatment with the antibody. The minimal mutants or preventing retreatment with the antibody. The minimal mutants or patients may be used to induce tolerance to the therapeutic antibody in patients. They can also be used in the manufacture of medicines for induction of tolerance.
                                                                                                                      Modified therapeutic antibody having reduced affinity for its antigen - can induce immunological tolerance, e.g. to Campath-1 monoclonal antibodies used in antibody therapy of lymphoma and

Sequence 8, Application US/09968561A;
Sequence 8, Application US/09968561A;
Patent No. US20020164642A1
GENERAL INFORMATION:
HAPPLICANT: Tomlingon, Ian M
APPLICANT: Winter, Gregory
TITLE OF INVENTION: Method to Screen Phage Display Libraries with Different Ligands;
TITLE REFERENCE: 8039/10/33B
CURRENT APPLICATION NUMBER: US/09/968,561A
CURRENT FILING DATE: 1997-10-01
FRIOR APPLICATION NUMBER: US 60/065,248
FRIOR FILING DATE: 1997-11-13
FRIOR FILING DATE: 1997-11-13
FRIOR FILING DATE: 1997-11-13

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 26, Application US/09828708
Patent No. US20020146753A1
GENERAL INFORMATION:
APPLICANT: Birton, D.
APPLICANT: Schaller, M.
TITLE OF INVENTION: Autoantibodies to glucose-6-phosphate isomerase and their particily TITLE OF INVENTION: Autoantibodies to glucose-6-phosphate isomerase and their particily TITLE OF INVENTION: AUTOIMMUNE disease
FILE REFERENCE: 1361.005US1
CURRENT FILING DATE: 2001-09-24
NUMBER OF SEQ ID NOS: 123
SOFTWARE: FastSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Patent No. 5604187

Patent No.
```

```
US-60-118-970B-5

1 Sequence 5, Application US/08318970B

1 Patent No. 5599573

2 REMERAL INFORMATION:

APPLICANT: Hideaki HAGIWARA, et al.

TITLE OF INVENTION: ANNIA ALIDEADES AGAINET ANTI-CANCER HUMAN MONOCLONAL

TITLE OF INVENTION: ANNIADOIES AGAINET ANTI-CANCER HUMAN MONOCLONAL

TITLE OF INVENTION: AND DNA BASE SEQUENCES ENCODING THOSE SEQUENCES

INVERSPONDENCE ADDRESS:

ADDRESSE: Law Office of Sherman and Shalloway

STREET: 413 N. Washington Street

CITY: Alexandria

STATE: Virginia

CONPITER: Dell System 210, Intel 80 285 Microprocessor

CONPITER: Word Perfect, Version 5.1

CONPITER: Word Perfect, Version 5.1

CURRENT APPLICATION NUMBER: 18, 26, 1994

CLASSIFCATION NUMBER: 26, 588

REGISTATION NUMBER: 26, 588

REPERENCE/DOCKET NUMBER: 8, 25, 318

TELLOROMYLICATION NUMBER: 26, 588

REFERENCE/DOCKET NUMBER: 8, 25, 318

TELLOROMYLICATION NUMBER: 26, 588

REFERENCE/DOCKET NUMBER: 8, 25, 318

TELLOROMYLICATION NUMBER: 26, 588

REFERENCE/DOCKET NUMBER: 8, 25, 318

TELLOROMYLICATION NUMBER: 9, 318

TELLOROMYLICATION NUMBER: 9, 318

TODOLOGY: Himear

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 6, Application US/08318970B

Sequence 6, Application US/08318970B

Patent No. 5589573

GENERAL INFORMATION:

APPLICANT: Hideaki HAGIWARA, et al.

TITLE OF INVENTION: AMINO ACID SEQUENCES OF ANTI-IDIOTYPIC

TITLE OF INVENTION: AND DAM BASE SEQUENCES ENCODING THOSE SEQUENCES

NUMBER OF SEQUENCES: 48

CORRESPONDENCE ADDRESS:

ADDRESSEE: Law Office of Sherman and Shalloway

STREET: Ala N. Washington Street

CITY: Alexandria

STATE: Virginia

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

JUS-264-02-22, Application US/08264093

Patent No. 5639863

Patent No. 5639863

JAPLICANT: Michael D. Dan
TITLE OF INVENTION: HUMAN MONOCLONAL ANTIBODIES SPECIFIC TO TITLE OF INVENTION: CELL CYCLE-INDEPENDENT GLIOMA SURFACE TITLE OF INVENTION: ANTIGEN
NUMBER OF SEQUENCES: 26
CORRESONDENCE ADDRESS: 36
CORRESONDENCE ADDRESS: ADDRESS: Ridout & Maybee STREET: 2300 Richmond-Adelaide Centre STREET: 101 Richmond Street West CITY: Toronto CITY: Toronto COUNTRY: Canada
STREET: 101 Richmond Street West CITY: Toronto COUNTRY: Canada
ZIP: MSH 2J7
COMPUTER: BADABLE FORM: MS-DOS 6.00
SOFTWARE: ASCII Editor
CURRENT APPLICATION NUMBER: US/08/264,093
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 19;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                       April 22, 2003, 12;48:49; Search time 16.625 Seconds (without alignments) 33.626 Million cell updates/sec

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                     April 22, 2003, 12:48:49 % Search time 7.875 Seconds (without alignments) 33.626 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Patent No. 5548658
GENERAL INFORMATION:
APPLICANT: Landry Donald, W.
ITILE OF INVENTION: ANTI-COCAINE CATALYTIC ANTIBODY
NUMBER OF SEQUENCES: 108
CORRESPONDENCE ADDRESS:
ADDRESSED:
CORRESPONDENCE TOOPER and Dunham LLP
STREET: 1185 Avenue of the Americas
CITY: New York
STATE: New York
COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

MEDIUM TYPE: Floppy disk

COMPUTER: ElbM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.30

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/672,345C

FILING DATE: 24-JUN-1996

CLIASSIFICATION: 435

ATTORNEY/AGENT INFORMATION:

NAME: White, John P.

REGISTRATION NUMBER: 0575/51400

TELEPRONE 12-278-0400

TELEFAX: 212-391-0525

INFORMATION FOR SEQ ID NO: 98:
SEQUENCE CHARACTERISTICS:
LENGTH: 113 amino acids

TYPE: amino acid

STRANDEDNESS: alingle

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                             April 22, 2003, 12:48:49; Search time 6.125 Seconds (without alignments) 33.626 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
